## 1 How to get it running

Go into the `app/` folder and start any simple HTTP server capable of serving files out of the current directory. We have included `serve.sh` which uses PHP to serve at `localhost:8080`.

Nothing else.

## 2 References

Everything that we know, we know from `bl.ocks.org`. The source code is composed of mainly `setup_*` and `draw_*` functions. When we took something from `bl.ocks.org`, we cited it above the relevant `setup_*` function.
